1. (10 points) (a) What is a function?

A mathematical function consists of a set of inputs called the domain, a set of outputs called the range, and a rule that gives exactly one output for every input.

(b) What does it mean for a function to be continuous?

A function is continuous if for every limit point of its domain, the function value and limit are defined and equal. That is,

$$\lim_{x \to a} f(x) = f(a)$$

for any a approached by the domain.

(c) Find the values of the real numbers A and B so that the piecewise function f defined below is continuous.

$$f(x) = \begin{cases} 2x^3 - 2x + 3 \text{ if } x \le 0\\ Ax + B \text{ if } 0 < x < 1\\ x^4 - x^3 - 6 \text{ if } x \ge 1 \end{cases}$$

To be continuous at 0 the two formulas on the different sides must be equal. so

$$\lim_{x \to 0^{-}} f(x) = 3 = B = \lim_{x \to 0^{+}} f(x)$$

and to be continuous at 1

$$\lim_{x \to 1^{-}} f(x) = A + B = -6 = \lim_{x \to 1^{+}} f(x)$$

So B = 3 and A = -9.

$$\lim_{x \to 2} \frac{(\sin(3x-6))^2}{x-2}$$

Remember that  $\lim_{x\to 0} \frac{\sin x}{x} = 1$  so  $\lim_{x\to 2} \frac{\sin(3x-6)}{(3x-6)} = 1$  by a change of variables. Then the desired limit is  $\lim_{x\to 2} \frac{3\sin(3x-6)\sin(3x-6)}{3(x-2)} = 3 \cdot 1 \cdot 0 = 0$ 

(b)

$$\lim_{x \to -4} \frac{x+4}{x+|x+4|+4}$$

The limit does not exist, since the function from above is  $\frac{1}{2}$ , but the

(c)

$$\lim_{x \to \infty} \frac{3x \cos x - 1}{x}$$

Similify to see the limit is  $\lim_{x\to\infty} 3\cos x - \frac{1}{x} = \lim_{x\to\infty} 3\cos x$ . So the limit does not exist since  $\cos$  is a periodic function that will continue to oscillate.

3. (8 points) (a) Give a formula for the inverse function  $f^{-1}$  to the function

$$f(x) = 3 \arctan(x/2 - \pi) + 1$$
  
 $f^{-1}(x) = 2 \tan\left(\frac{y-1}{3}\right) + 2\pi$ 

(b) An investment account with \$300 pays continuously compounded interest at an annual rate of 3%, so that the value V(t) of the account after t years is  $V(t) = 300e^{0.03t}$ . How many years will it take for the investment to triple? (Give your result as a functional expression—you do not need to give a decimal number.) If  $t_0$  is the time when the investment triples we have  $e^{0.03t_0} = 3$  so

$$t_0 = \frac{\ln 3}{0.03}$$

4. (8 points) (a) What is an asymptote?

An asymptote for the graph of a function y = f(x) is a line that the graph approaches arbitrary close as x or y tend to  $\pm \infty$ .

(b) Find all the asymptotes of the following rational function g.

$$g(x) = \frac{2(x-1)^2}{x+8}$$

There is a vertical asymptote at x = -8 and since  $\frac{2(x-1)^2}{x+8} = 2x-20 + \frac{1}{x+8}$  an oblique asymptote given by  $y = 2x - 20 + \frac{81}{x+8}$ 

5. (8 points) (a) What does the Squeeze Theorem of Limits say?

The Squeeze Theorem says that if there are functions f, g, and h such that  $f(x) \leq g(x) \leq h(x)$  for all x near a and if the limits  $\lim_{x\to a} f(x) = \lim_{x\to a} h(x)$  exist then so does  $\lim_{x\to a} g(x)$  and  $\lim_{x\to a} f(x) = \lim_{x\to a} g(x) = \lim_{x\to a} h(x)$ 

(b) For any real number x, the arctan function satisfies the inequality

$$-\frac{1}{3} + \frac{1}{5}x^2 - \frac{1}{7}x^4 \le \frac{\arctan(x) - x}{x^3} \le -\frac{1}{3} + \frac{1}{5}x^2$$

Use the inequality (or any other method) to compute the limit

$$\lim_{x \to 0} \frac{\arctan(x) - x}{x^3} =$$

According to the Squeeze theorem we can compute the limit of the two bounding functions of x. Setting x = 0 in to both of these gives a value of  $-\frac{1}{3}$  so

$$\lim_{x \to 0} \frac{\arctan(x) - x}{x^3} = -\frac{1}{3}$$
